Some additional theory tidbits

- What if Python didn't have for/ while loops, but had something else – e.g. "goto line i"
 - how does this affect what we can compute?
- Turing machines: important theoretical "universal computer"
 - memory: infinitely long "tape" of cells that can be blank or contain 0 or 1
 - program: a set of "states" and one fundamental operation:
 if state == q and tape cell == x, set cell to y, state to q', move
- This simple computer can compute anything that is computable!

- <u>A simulator</u>
- <u>A "real" one</u> ☺

while										
n = 0										
while n < 100:										
sum = sum + n										
n = n + 1										
print sum										

VS.

goto plus a simpler form of ifstatement that has no "body"just a possible goto *linenum*

1. n = 0

- 2. If ??? goto ???
- 3. sum = sum + n
- 4. n = n + 1
- 5. ???
- 6. print sum

while vs. goto

n = 0 while n < 100: sum = sum + n n = n + 1 print sum

- 1. n = 0
- 2. if n >= 100 goto 6
- 3. sum = sum + n
- 4. n = n + 1
- 5. goto 2
- 6. print sum

More CS theory

- <u>P vs. NP</u> the biggest unsolved problem in computer science
 - there are many problems that we don't know *efficient* algorithms for, and don't even know whether or not efficient ones even exist
 - Hundreds of real-world have been shown to be NP-complete
 - this means that if you solve any one of them, we can efficiently convert that solution into a solution for the rest of them. Solve one efficiently → solve all efficiently!
 - Longest path (but not shortest path), graph coloring, subset sum, many puzzles (Sudoku (<u>!</u>, <u>?</u>, <u>?</u>, <u>solvers</u>, <u>hardest??</u>, <u>solver???</u>, <u>solver!</u>, <u>thoughts</u>), minesweeper, etc.), <u>satisfiability</u> <u>of logic formulas</u>, nonograms (demo: nopuzzle.py)Traveling Salesperson (<u>movie</u>!?)
 - Solve it for extra practice this week == <u>\$1 million</u>?
 - Demo: sudoku solver using "dancing links" algorithm sudoku.py

• Regarding puzzles:

Hundreds/thousands of logic puzzle types

- Some cs (and other) research on puzzle design lots of mobile games are puzzles – how are good puzzle levels made – via algorithm? by hand? <u>Are hand-made ones</u> <u>better?</u>
- A recommended puzzle site (there are *many* good ones but this one provides an interesting variety of carefully hand-crafted ones, once per month, by CS PhD Pavel Curtis, who works at Microsoft)

The Halting Problem (later this week)

- it's important to know what we can and can't compute
- It turns out that we cannot create program that can check all other programs for infinite loops
- see, e.g., <u>http://en.wikipedia.org/wiki/Halting_problem</u>
- First: demonstrate that we can write programs that create and execute new programs/functions. testProgramOnInput.py
- Informal proof that we can't write doesItHalt
 - why can't we create fully correct doesItHalt function? (doesItHalt.py)
 - To see why, consider function test in doesItHaltTest.py
