Introduction to Automated Reasoning

Theory Solvers III

Cesare Tinelli

Spring 2024

Credits

These slides are based on slides originally developed by **Cesare Tinelli** at the University of Iowa, and by **Clark Barrett**, **Caroline Trippel**, and **Andrew (Haoze) Wu** at Stanford University. Adapted by permission.

Roadmap for Today

Theory Solvers

- Strings

Motivation: Symbolic Execution

Symbolic Execution

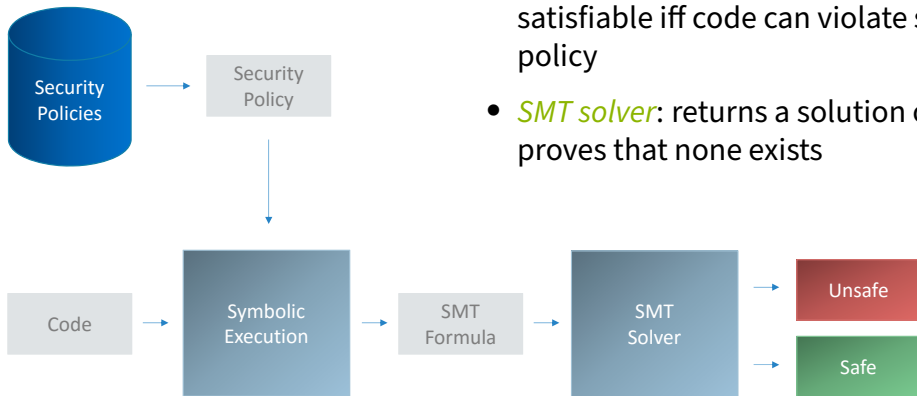

- *Enumerate program paths* that end in a bad state
 - (e.g., invalid memory access)
- Represent program *inputs* as SMT *variables*
- Translate *statements* in the path into *constraints* on the variables
- Constraints represent *all possible executions* along the path
- Solving the constraints determines whether the path is *feasible*

Example: Symbolic Execution for Security

Security Vulnerabilities

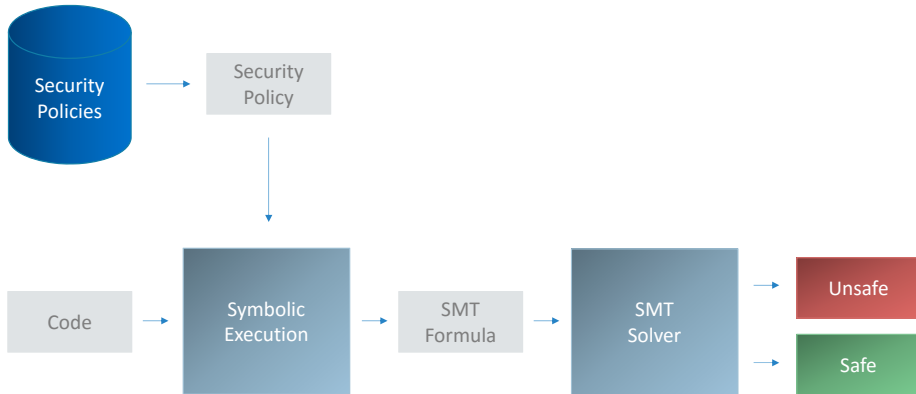

- Input: *code* and *security policy*
- *Symbolic execution*: generates formula satisfiable iff code can violate security policy
- *SMT solver*: returns a solution or proves that none exists

String Analysis

Strings in Symbolic Execution

- Input code may manipulate *strings*

Basic Theory of Strings

Alphabet

\mathcal{A} fixed *finite* set of characters

Constants

Empty string $\epsilon : \text{String}$ (i.e., $\text{rank}(\epsilon) = \langle \text{String} \rangle$)

Character string $c : \text{String}$ for all $c \in \mathcal{A}$

Integer numeral $n : \text{Int}$ for all $n \geq 0$

Operators

Concatenation $_ \cdot _ : \text{String} \times \text{String} \rightarrow \text{String}$ (i.e., $\text{rank}(\cdot) = \langle \text{String}, \text{String}, \text{String} \rangle$)

Length $|_ | : \text{String} \rightarrow \text{Int}$

Membership $_ \in _ : \text{String} \times \text{Regex} \rightarrow \text{Bool}$

Addition $_ + _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Comparison $_ > _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Basic Theory of Strings

Alphabet

\mathcal{A} fixed *finite* set of characters

Constants

Empty string $\epsilon : \text{String}$ (i.e., $\text{rank}(\epsilon) = \langle \text{String} \rangle$)

Character string $c : \text{String}$ for all $c \in \mathcal{A}$

Integer numeral $n : \text{Int}$ for all $n \geq 0$

Operators

Concatenation $_ \cdot _ : \text{String} \times \text{String} \rightarrow \text{String}$ (i.e., $\text{rank}(\cdot) = \langle \text{String}, \text{String}, \text{String} \rangle$)

Length $|_ | : \text{String} \rightarrow \text{Int}$

Membership $_ \in _ : \text{String} \times \text{Regex} \rightarrow \text{Bool}$

Addition $_ + _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Comparison $_ > _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Basic Theory of Strings

Alphabet

\mathcal{A} fixed *finite* set of characters

Constants

Empty string $\epsilon : \text{String}$ (i.e., $\text{rank}(\epsilon) = \langle \text{String} \rangle$)

Character string $c : \text{String}$ for all $c \in \mathcal{A}$

Integer numeral $n : \text{Int}$ for all $n \geq 0$

Operators

Concatenation $_ \cdot _ : \text{String} \times \text{String} \rightarrow \text{String}$ (i.e., $\text{rank}(\cdot) = \langle \text{String}, \text{String}, \text{String} \rangle$)

Length $|_ | : \text{String} \rightarrow \text{Int}$

Membership $_ \in _ : \text{String} \times \text{Regex} \rightarrow \text{Bool}$

Addition $_ + _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Comparison $_ > _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Basic Theory of Strings

Alphabet

A fixed finite set

Constants

Empty string ϵ

Character string c

Integer numeral n

Operators

Concatenation \cdot : $String \times String \rightarrow String$ (i.e., $rank(\cdot) = \langle String, String, String \rangle$)

Length $| _ |$: $String \rightarrow Int$

Membership \in : $String \times RegEx \rightarrow Bool$

Addition $+$: $Int \times Int \rightarrow Int$

Comparison $>$: $Int \times Int \rightarrow Int$

Challenge: complexity

concatenation + equality: *word equations problem*

- Decidable in PSPACE

+ length

- Decidability open

+ replace (all instances of some substring)

- Undecidable

Basic Theory of Strings

Alphabet

\mathcal{A} fixed finite set of characters

Pragmatic approach

- Rule-based proof system
- Use existing arithmetic theory solver
- Embrace incompleteness

Constants

Empty string $\epsilon : \text{String}$

Character string $c : \text{String}$

Integer numeral $n : \text{Int}$ for all $n \geq 0$

Operators

Concatenation $_ \cdot _ : \text{String} \times \text{String} \rightarrow \text{String}$ (i.e., $\text{rank}(\cdot) = \langle \text{String}, \text{String}, \text{String} \rangle$)

Length $|_ | : \text{String} \rightarrow \text{Int}$

Membership $_ \in _ : \text{String} \times \text{Regex} \rightarrow \text{Bool}$

Addition $_ + _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Comparison $_ > _ : \text{Int} \times \text{Int} \rightarrow \text{Int}$

Satisfiability Proof System for Strings

Proof States

A *proof state* is either:

- One of the distinguished states SAT, UNSAT
- A pair $\langle S; A \rangle$, where S contains *string* constraints and A contains *arithmetic* constraints

Assumptions

- All literals are flat
- For every string variable x in S , there exists a variable l_x , such that $l_x = |x| \in S$
- Ignore regular expression membership for now

Notation

Definitions

- $\mathcal{T}(S)$ denotes all terms in S
- $S \models \alpha$ means that α follows from S using the rules of QF_UF
- $A \models_{LIA} \alpha$ means that α follows from A in the theory of linear integer arithmetic

Normalization function for length

- $|\epsilon|_{\downarrow} = 0$
- $|c|_{\downarrow} = 1$ for all $c \in \mathcal{A}$
- $|s_1 \cdot \dots \cdot s_n|_{\downarrow} = |s_1|_{\downarrow} + \dots + |s_n|_{\downarrow}$

Core Rules

$$\text{A-CONF} \frac{A \models_{LIA} \perp}{\text{UNSAT}}$$

$$\text{A-PROP} \frac{A \models_{LIA} s \doteq t \quad s, t \in \mathcal{T}(S)}{S := S, s \doteq t}$$

$$\text{S-CONF} \frac{S \models \perp}{\text{UNSAT}}$$

$$\text{S-PROP} \frac{S \models s \doteq t \quad s, t \in \mathcal{T}(S) \quad s, t \text{ are } \Sigma_{LIA}\text{-terms}}{A := A, s \doteq t}$$

$$\text{S-A} \frac{x, y \in \mathcal{T}(S) \cap \mathcal{T}(A) \quad x, y : \text{Int}}{A := A, x \doteq y \quad A := A, x \doteq y}$$

$$\text{L-INTRO} \frac{s \in \mathcal{T}(S) \quad s : \text{String}}{S := S, |s| \doteq |s| \downarrow}$$

$$\text{L-VALID} \frac{x \in \mathcal{T}(S) \quad x : \text{String}}{S := S, x \doteq \epsilon \quad A \doteq A, l_x > 0}$$

$$\text{CONST-CONF} \frac{S \models c \doteq d \quad c \in \mathcal{A} \quad d \in \mathcal{A} \setminus \{c\}}{\text{UNSAT}}$$

$$\text{SAT} \frac{\text{no other rule applies}}{\text{SAT}}$$

Example Derivation

Let $S_0 = \{x \doteq y \cdot x \cdot z, y \doteq "a", l_x \doteq |x|, l_y \doteq |y|, l_z \doteq |z|\}$
 $A_0 = \emptyset$

$\langle S_0; A_0 \rangle$	
$\langle y \cdot x \cdot z \doteq y + x + z ; \emptyset \rangle$	
$\langle "a" \doteq 1; \emptyset \rangle$	
$\langle \emptyset; l_x \doteq l_y + l_x + l_z \rangle$	
$\langle \emptyset; l_y \doteq 1 \rangle$	
$\langle z \doteq \epsilon; \emptyset \rangle$	$\langle \emptyset; l_z > 0 \rangle$
$\langle c \doteq 0; \emptyset \rangle$	UNSAT
$\langle \emptyset; l_z \doteq 0 \rangle$	
UNSAT	

For each derivation step, we show only the difference between the derived state and the previous one

Example Derivation

Let $S_0 = \{x \doteq y \cdot x \cdot z, y \doteq "a", l_x \doteq |x|, l_y \doteq |y|, l_z \doteq |z|\}$
 $A_0 = \emptyset$

$$\begin{array}{c} \langle S_0; A_0 \rangle \\ \hline \langle |y \cdot x \cdot z| \doteq |y| + |x| + |z|; \emptyset \rangle \\ \hline \langle |"a"| \doteq 1; \emptyset \rangle \\ \hline \langle \emptyset; l_x \doteq l_y + l_x + l_z \rangle \\ \hline \langle \emptyset; l_y \doteq 1 \rangle \\ \hline \begin{array}{cc} \langle z \doteq \epsilon; \emptyset \rangle & \langle \emptyset; l_z > 0 \rangle \\ \hline \langle |\epsilon| \doteq 0; \emptyset \rangle & \text{UNSAT} \\ \hline \langle \emptyset; l_z \doteq 0 \rangle & \\ \hline \text{UNSAT} & \end{array} \end{array}$$

For each derivation step, we show only the **difference** between the derived state and the previous one

Concatenation Rules

If x is a variable of S , we can recursively expand x by substituting using equalities from S whose right-hand sides are concatenation terms until this is no longer possible

If t is the result, we write $S \vdash^* x = t$

We write z as a short-hand for a concatenation of zero or more variables

($z = z_1 \cdot z_2 \cdot \dots \cdot z_n$, with $z = \epsilon$ when $n = 0$)

$$\text{C-EQ} \frac{S \vdash^* x = z \quad S \vdash^* y = z}{S := S, x = y}$$

$$\text{C-SPLIT} \frac{S \vdash^* x = w \cdot u \cdot z \quad S \vdash^* x = w \cdot v \cdot z'}{A := A, l_u > l_v; S := S, u = v \cdot k \\ A := A, l_u < l_v; S := S, v = u \cdot k \\ A := A, l_u = l_v; S := S, u = v}$$

Note: k is a fresh variable

Concatenation Rules

If x is a variable of S , we can recursively expand x by substituting using equalities from S whose right-hand sides are concatenation terms until this is no longer possible

If t is the result, we write $S \models^* x = t$

We write z as a short-hand for a concatenation of zero or more variables
($z = z_1 \cdot z_2 \cdot \dots \cdot z_n$, with $z = \epsilon$ when $n = 0$)

$$\text{C-EQ} \frac{S \models^* x \doteq z \quad S \models^* y \doteq z}{S := S, x \doteq y}$$

$$\text{C-SPLIT} \frac{S \models^* x \doteq w \cdot u \cdot z \quad S \models^* x \doteq w \cdot v \cdot z'}{A := A, l_u > l_v; S := S, u \doteq v \cdot k} \\ A := A, l_u < l_v; S := S, v \doteq u \cdot k \\ A := A, l_u \doteq l_v; S := S, u \doteq v$$

Note: k is a fresh variable

Concatenation Rules

If x is a variable of S , we can recursively expand x by substituting using equalities from S whose right-hand sides are concatenation terms until this is no longer possible

If t is the result, we write $S \models^* x = t$

We write \mathbf{z} as a short-hand for a concatenation of zero or more variables
($\mathbf{z} = z_1 \cdot z_2 \cdot \dots \cdot z_n$, with $\mathbf{z} = \epsilon$ when $n = 0$)

$$\text{C-EQ} \frac{S \models^* x \doteq \mathbf{z} \quad S \models^* y \doteq \mathbf{z}}{S := S, x \doteq y}$$

$$\text{C-SPLIT} \frac{S \models^* x \doteq w \cdot u \cdot \mathbf{z} \quad S \models^* x \doteq w \cdot v \cdot \mathbf{z}'}{A := A, l_u > l_v; S := S, u \doteq v \cdot k \\ A := A, l_u < l_v; S := S, v \doteq u \cdot k \\ A := A, l_u \doteq l_v; S := S, u \doteq v}$$

Note: k is a fresh variable

Concatenation Rules

$$\text{C-SPLIT} \frac{S \models^* x \doteq \mathbf{w} \cdot \mathbf{u} \cdot \mathbf{z} \quad S \models^* x \doteq \mathbf{w} \cdot \mathbf{v} \cdot \mathbf{z}'}{\begin{array}{l} A := A, l_u > l_v; S := S, u \doteq v \cdot k \\ A := A, l_u < l_v; S := S, v \doteq u \cdot k \\ A := A, l_u \doteq l_v; S := S, u \doteq v \end{array}}$$

Note: k is a fresh variable

Example of C-Split

$$\text{C-SPLIT} \frac{S \models^* x \doteq w \cdot u \cdot z \quad S \models^* x \doteq w \cdot v \cdot z'}{A := A, l_u > l_v; S := S, u \doteq v \cdot k \quad A := A, l_u < l_v; S := S, v \doteq u \cdot k \quad A := A, l_u \doteq l_v; S := S, u \doteq v}$$

Core and Concat Rules

$$\text{A-CONF} \frac{A \models_{LIA} \perp}{\text{UNSAT}}$$

$$\text{A-PROP} \frac{A \models_{LIA} s \doteq t \quad s, t \in \mathcal{T}(S)}{S := S, s \doteq t}$$

$$\text{S-CONF} \frac{S \models \perp}{\text{UNSAT}}$$

$$\text{S-PROP} \frac{S \models s \doteq t \quad s, t \in \mathcal{T}(S) \quad s, t \text{ are } \Sigma_{LIA}\text{-terms}}{A := A, s \doteq t}$$

$$\text{CONST-CONF} \frac{S \models c \doteq d \quad c \in \mathcal{A} \quad d \in \mathcal{A} \setminus \{c\}}{\text{UNSAT}}$$

$$\text{S-A} \frac{x, y \in \mathcal{T}(S) \cap \mathcal{T}(A) \quad x, y : \text{Int}}{A := A, x \doteq y \quad A := A, x \doteq y}$$

$$\text{L-INTRO} \frac{s \in \mathcal{T}(S) \quad s : \text{String}}{S := S, |s| \doteq |s| \downarrow}$$

$$\text{L-VALID} \frac{x \in \mathcal{T}(S) \quad x : \text{String}}{S := S, x \doteq \epsilon \quad A \doteq A, l_x > 0}$$

$$\text{SAT} \frac{\text{no other rule applies}}{\text{SAT}}$$

$$\text{C-EQ} \frac{S \models^* x \doteq \mathbf{z} \quad S \models^* y \doteq \mathbf{z}}{S := S, x \doteq y}$$

$$\text{C-SPLIT} \frac{S \models^* x \doteq \mathbf{w} \cdot \mathbf{u} \cdot \mathbf{z} \quad S \models^* x \doteq \mathbf{w} \cdot \mathbf{v} \cdot \mathbf{z}'}{A := A, l_u > l_v; S := S, u \doteq v \cdot k \\ A := A, l_u < l_v; S := S, v \doteq u \cdot k \\ A := A, l_u \doteq l_v; S := S, u \doteq v}$$

Properties of the proof system

Is the proof system sound? terminating?

Properties of the proof system

The proof system is

- refutation sound
 - easily checkable by examining each proof rule
- solution sound
 - proving this is highly non-trivial
- not terminating
 - for pathological unsat cases, C-SPLIT can be applied infinitely often
- incomplete
 - a consequence of non-termination

Properties of the proof system

The proof system is

- **refutation sound**
 - easily checkable by examining each proof rule

Iterating to Improve the Solver

The first version of the proof system was implemented in 2014

Based on requests and feedback from users,
a number of iterative improvements have been made

More String Operators

SMT user: That's great but I need more operators!

Iterate and Improve

1. Extend the theory by adding *new operators*

- $\text{substr}(x, n, m) : \text{String}$, the maximal substring of x , starting at position n , with length at most m
- $\text{contains}(x, y) : \text{Bool}$, true iff x contains y as a substring
- $\text{index_of}(x, y, n) : \text{Int}$, position of the first occurrence of y in x , starting from position n
- $\text{replace}(x, y, z) : \text{String}$, the result of replacing the first occurrence of x in y by z

2. Implement them by reduction to the core theory

$$\text{contains}(y, z) \equiv \exists k. 0 \leq k \leq |y| - |z| \wedge \text{substr}(y, k, |z|) \dot{=} z$$

$$x \dot{=} \text{index_of}(y, z, n) \equiv \text{ite}(0 \leq n \leq |y| \wedge \text{contains}(y', z), \\ \text{substr}(y', x', |z|) \dot{=} z \wedge \neg \text{contains}(\text{substr}(y', 0, x' + |z| - 1), z), \\ x \dot{=} -1)$$

with $y' \dot{=} \text{substr}(y, n, |y| - n)$ and $x' \dot{=} x - n$

$$x \dot{=} \text{replace}(y, z, w) \equiv \text{ite}(\text{contains}(y, z) \wedge z \dot{=} \epsilon, \\ x \dot{=} z_1 \cdot w \cdot z_2 \wedge y \dot{=} z_1 \cdot z \cdot z_2 \wedge \text{index_of}(y, z, 0) \dot{=} |z_1|, \\ x \dot{=} y)$$

Reasoning about New Operators

SMT user: That's great but now it's too slow!

Iterate and Improve

- Extend the implementation to reason directly on the new operators
- How?
 - Keep formulas with original new operators
 - Periodically try to simplify them based on new knowledge

Reasoning about New Operators

SMT user: That's great but now it's too slow!

Iterate and Improve

- Extend the implementation to **reason directly** on the new operators
- How?
 - Keep formulas with original new operators
 - Periodically try to simplify them based on new knowledge

Simplification rules for New Operators

Example: `contains`

(l_1, l_2 denote string constants)

$\text{contains}(l_1, l_2) \longrightarrow \top$	if l_1 contains l_2

Too Domain-Specific?

SMT user: Wow! - but after all that, I bet you really overfit to that one symbolic execution domain, right?

Amazon Automated Reasoning Group:

- We really like your string solver
- and we are calling it a few **billion** times a day
- to secure access control policies in the cloud for our customers!

Zelkova

Security Policy

```
(allow,  
principal      :*,  
action         : getObject,  
resource       : cs240/*,  
condition      : (StringEquals, aws:sourceVpc, vpc-111bbb222),  
                (StringLike, s3:prefix, cs240/Exam*))
```

SMT Encoding

```
a = "getObject" ^ r = "cs240/*" ^ vpcExists ^  
vpc = "vpc-111bbb222" ^ s3PrefixExists ^  
"cs240/Exam" prefixOf s3Prefix
```

SMT Solvers (cvc5 and z3)

Strings and RegExp

Bitvectors

Arithmetic

One More Thing

Amazon Automated Reasoning Group:

- Just one small thing though...
- We use a lot of *regular expressions* membership queries
- I don't suppose you could speed those up a bit?

One More Thing

Amazon Automated Reasoning Group:

- Just one small thing though...
- We use a lot of *regular expressions* membership queries
- I don't suppose you could speed those up a bit?

Reasoning about Regular Expressions

Regular Expression Membership Example

$$\begin{aligned}x &\in [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^* \wedge \\x &\notin [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^*\end{aligned}$$

Automata-based approach

$$\frac{x \in R_1 \quad x \notin R_2}{x \in R_1 \cap \text{comp}(R_2)}$$

Problem:

Reasoning about Regular Expressions

Regular Expression Membership Example

$$\begin{aligned}x &\in [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^* \wedge \\x &\notin [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^*\end{aligned}$$

Automata-based approach

$$\frac{x \in R_1 \quad x \notin R_2}{x \in R_1 \cap \text{comp}(R_2)}$$

Problem: Complement and intersection are **expensive**

Reasoning about Regular Expressions

Regular Expression Membership Example

$$\begin{aligned}x &\in [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^* \wedge \\x &\notin [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^*\end{aligned}$$

Automata-based approach

$$\frac{x \in R_1 \quad x \notin R_2}{x \in R_1 \cap \text{comp}(R_2)}$$

Problem: Membership constraints may lead to non-terminating unfolding:

Example: $x_1 \in [0..9]^*$ is equivalent to

$$x \doteq \epsilon \vee x \in [0..9] \vee (\exists u, v, w. x \doteq u \cdot v \cdot w \wedge u \in [0..9] \wedge v \in [0..9]^* \wedge w \in [0..9])$$

Reasoning about Regular Expressions

Regular Expression Membership Example

$$\begin{aligned}x &\in [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^* \wedge \\x &\notin [0..9]^* \cdot \text{"a"} \cdot \mathcal{A}^*\end{aligned}$$

Word-based approach with incomplete procedures

$$\frac{x \in R_1 \quad x \notin R_2 \quad \mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)}{\text{UNSAT}}$$

- Use fast, incomplete procedure to verify $\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)$

Notation: $\mathcal{L}(R)$ denotes the language generated by regex R

Proving $\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)$

$$(1) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R)}$$

$$(2) \frac{}{\mathcal{L}(\epsilon) \subseteq \mathcal{L}(R^*)}$$

$$(3) \frac{\text{for all } x \in \mathcal{L}(R), |x| = 1}{\mathcal{L}(R) \subseteq \mathcal{L}(A)}$$

$$(4) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(A^*)}$$

$$(5) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R^*)}$$

$$(6) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)}{\mathcal{L}(R_1^*) \subseteq \mathcal{L}(R_2^*)}$$

$$(7) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(R_3)}{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_3)}$$

$$(8) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(S_1) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(S_2)}{\mathcal{L}(R_1 \cdot R_2) \subseteq \mathcal{L}(S_1 \cdot S_2)}$$

$$(9) \frac{c_3 \preceq c_1 \quad c_2 \preceq c_4}{\mathcal{L}([c_1 \cdot c_2]) \subseteq \mathcal{L}([c_3 \cdot c_4])}$$

$c \preceq d$ iff c equals d or precedes d lexicographically ($c, d \in A$)

Proving $\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)$

$$(1) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R)} \quad (2) \frac{}{\mathcal{L}(\epsilon) \subseteq \mathcal{L}(R^*)} \quad (3) \frac{\text{for all } x \in \mathcal{L}(R), |x| = 1}{\mathcal{L}(R) \subseteq \mathcal{L}(\mathcal{A})}$$

$$(4) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(\mathcal{A}^*)} \quad (5) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R^*)} \quad (6) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)}{\mathcal{L}(R_1^*) \subseteq \mathcal{L}(R_2^*)}$$

$$(7) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(R_3)}{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_3)}$$

$$(8) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(S_1) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(S_2)}{\mathcal{L}(R_1 \cdot R_2) \subseteq \mathcal{L}(S_1 \cdot S_2)} \quad (9) \frac{c_3 \preceq c_1 \quad c_2 \preceq c_4}{\mathcal{L}([c_1 \cdot c_2]) \subseteq \mathcal{L}([c_3 \cdot c_4])}$$

$c \preceq d$ iff c equals d or precedes d lexicographically ($c, d \in \mathcal{A}$)

Proving $\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)$

$$(1) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R)} \quad (2) \frac{}{\mathcal{L}(\epsilon) \subseteq \mathcal{L}(R^*)} \quad (3) \frac{\text{for all } x \in \mathcal{L}(R), |x| = 1}{\mathcal{L}(R) \subseteq \mathcal{L}(\mathcal{A})}$$

$$(4) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(\mathcal{A}^*)} \quad (5) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R^*)} \quad (6) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)}{\mathcal{L}(R_1^*) \subseteq \mathcal{L}(R_2^*)}$$

$$(7) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(R_3)}{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_3)}$$

$$(8) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(S_1) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(S_2)}{\mathcal{L}(R_1 \cdot R_2) \subseteq \mathcal{L}(S_1 \cdot S_2)} \quad (9) \frac{c_3 \preceq c_1 \quad c_2 \preceq c_4}{\mathcal{L}([c_1 \cdot c_2]) \subseteq \mathcal{L}([c_3 \cdot c_4])}$$

$c \preceq d$ iff c equals d or precedes d lexicographically ($c, d \in \mathcal{A}$)

Proving $\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)$

$$(1) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R)} \quad (2) \frac{}{\mathcal{L}(\epsilon) \subseteq \mathcal{L}(R^*)} \quad (3) \frac{\text{for all } x \in \mathcal{L}(R), |x| = 1}{\mathcal{L}(R) \subseteq \mathcal{L}(\mathcal{A})}$$

$$(4) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(\mathcal{A}^*)} \quad (5) \frac{}{\mathcal{L}(R) \subseteq \mathcal{L}(R^*)} \quad (6) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2)}{\mathcal{L}(R_1^*) \subseteq \mathcal{L}(R_2^*)}$$

$$(7) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_2) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(R_3)}{\mathcal{L}(R_1) \subseteq \mathcal{L}(R_3)}$$

$$(8) \frac{\mathcal{L}(R_1) \subseteq \mathcal{L}(S_1) \quad \mathcal{L}(R_2) \subseteq \mathcal{L}(S_2)}{\mathcal{L}(R_1 \cdot R_2) \subseteq \mathcal{L}(S_1 \cdot S_2)} \quad (9) \frac{c_3 \leq c_1 \quad c_2 \leq c_4}{\mathcal{L}([c_1..c_2]) \subseteq \mathcal{L}([c_3..c_4])}$$

$c \leq d$ iff c equals d or precedes d lexicographically ($c, d \in \mathcal{A}$)

Exercise

Using the proof rules above, prove that

$$\mathcal{L}([0..1]^* \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^*) \subseteq \mathcal{L}([0..9]^* \cdot \mathcal{A}^*)$$

$$\frac{\frac{0 \leq 0 \quad 1 \leq 9}{\mathcal{L}([0..1]) \subseteq \mathcal{L}([0..9])} \quad (9)}{\mathcal{L}([0..1]^*) \subseteq \mathcal{L}([0..9]^*)} \quad (6) \quad \frac{}{\mathcal{L}(\mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^*) \subseteq \mathcal{L}(\mathcal{A}^*)} \quad (4)$$

$$\mathcal{L}([0..1]^* \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^*) \subseteq \mathcal{L}([0..9]^* \cdot \mathcal{A}^*) \quad (8)$$

Exercise

Using the proof rules above, prove that

$$\mathcal{L}([0..1]^* \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^*) \subseteq \mathcal{L}([0..9]^* \cdot \mathcal{A}^*)$$

$$\frac{\frac{0 \leq 0 \quad 1 \leq 9}{\mathcal{L}([0..1]) \subseteq \mathcal{L}([0..9])} \quad (9)}{\mathcal{L}([0..1]^*) \subseteq \mathcal{L}([0..9]^*)} \quad (6) \quad \frac{}{\mathcal{L}(\mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^*) \subseteq \mathcal{L}(\mathcal{A}^*)} \quad (4)$$
$$\frac{}{\mathcal{L}([0..1]^* \cdot \mathcal{A}^* \cdot \text{"b"} \cdot \mathcal{A}^*) \subseteq \mathcal{L}([0..9]^* \cdot \mathcal{A}^*)} \quad (8)$$
